

Traffic Pirate

BETA

THANK YOU FOR PURCHASING THIS TOOL. IF YOU HAVE ANY QUESTIONS YOU CAN REACH ME ON TELEGRAM @TP-Dev

- **Custom auto-reply to DMs**
(ChatGPT plug-in or Nested Sintax supported)
- **Scheduled auto-swipers**
(To keep account activity high and current)
- **Mass account creation**
(Import images or default uses temp mail with auto-activating inbox)
- **Cleans all photos before upload**
(So you can safely reuse the same photos over and over again)

When the menu asks, you'll need to enter your;

- Email list or email API.
 - Phone number list, or API.
 - If you choose not to use the free proxies you'll have an opportunity to input your proxy list.
 - Also you will need a 2CAPTCHA API or HCAPTCHA API depending on what platform you'll be automating.
-

At the time of this writing this bot currently supports;

- Tinder
- Bumble
- Badoo
- OKCupid
- Plenty of Fish
- Reddit
- Twitter

More platforms will be added as the beta process proceeds. Likewise some platforms will likely be removed due to patches.

If your antivirus blocks the download or script like windows defender sometimes does, you'll need to turn off the antivirus while you set up the bot. The method that I use to scrape the proxies for you seems to trigger a couple different anti-viruses with a false positive. It'll work fine once you either create an exclusion for the directory you're downloading the zip file into, or just turning off "real-time monitoring" temporarily.

We shouldn't get the false positives anymore now that we have our licensing issued, but sometimes the AV companies are slow to update certificates.

To make an exclusion folder go in to your computers settings and select "Privacy & Security" ...then "Windows Security"

Choose "Virus & Threat Protection" Then "Manage Settings"

You may or may not already have folders there, either way just scroll down till you see "Exclusions" and click "Add or Remove Exclusions" click "Add an Exclusion"

Happy Pirating!

Traffic Pirate

BETA

In the drop down menu
select "Folder"

When the 'browse' window comes up copy &
paste this into the 'Folder' input field;

`%USERPROFILE%\Downloads\TPBot-main`

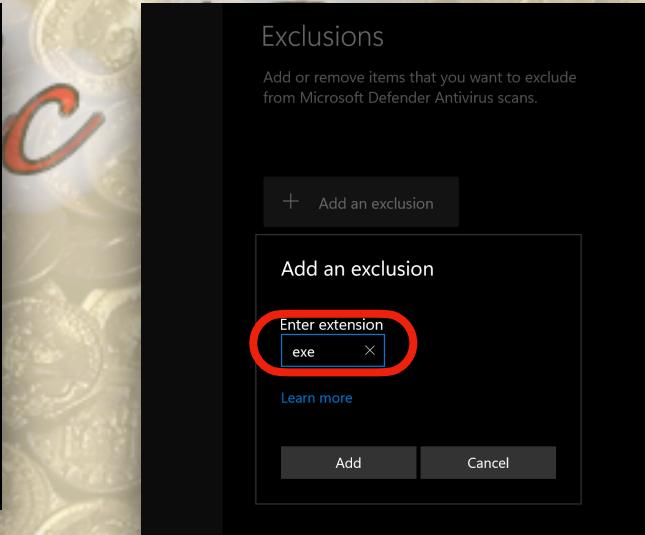

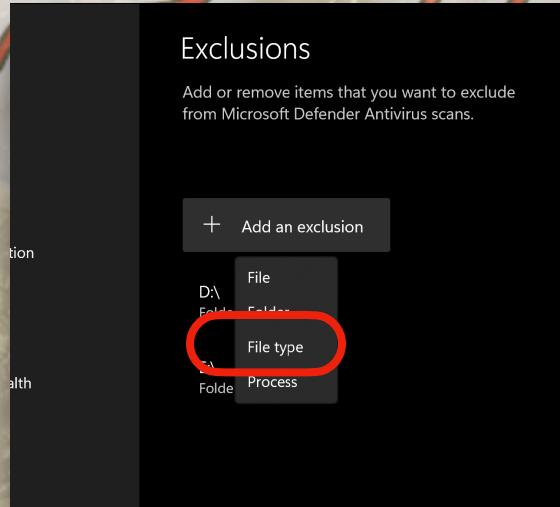

Select the name of the extracted directory

YOU CAN ALSO DO THIS...

When you get
the drop down menu, select
"File type"

And here it wants you to type in the
file extension of the bot, which
is exe so type "exe" then
click "Add"

You must create the above exclusion that covers the "TPBot-main" directory BEFORE you extract the "TrafficPirate(Binaries).7z" archive, for which the password to decrypt is **betaTest**

- Now you can enter the "TPBot-main" directory and extract the 'binaries' 7z file with whichever software you prefer. If you've performed the above exclusion correctly you should have no further issues.
- Once you **extract the "TrafficBot(Binaries).7z" directory**, you'll see 2 new files in the "main" directory. There will be an "uninstall.zip" which you only need to uninstall or purge log files, the other one is the "TrafficBotStartup1"... That's the bot itself.
- Double click on the "TrafficBotStartup1" file** to set up dependencies and start the bot.
- Once the main menu appears the rest is self explanatory.
- Just follow the GUI prompts and fill out the input information.
- Click 'Deploy' to start the bot live.**
(OR)
Click 'Debug' to start the bot in a local environment for testing. (this is only needed for submitting a bug report)

The bot uses a free API library written by me to utilize rotating proxies scraped with another bot I have hosted in the cloud. When the bot calls this library, the function may be blocked by windows or you may get a notification that has a **'Run Anyway'** option... If you don't see that try **"More Info"** then **"Run Anyway"**
