

## Traffic Pirate Bot

THANK YOU FOR PURCHASING THIS TOOL. IF YOU HAVE ANY QUESTIONS YOU CAN REACH ME ON TELEGRAM @TP-Dev

- Make sure you do NOT include '@' in your Snapchat, Reddit, or Twitter usernames.

***When the menu asks, you'll need to enter your;***

- Email list or email API.
  - Phone number list, or API.
  - If you choose not to use the free proxies you'll have an opportunity to input your proxy list.
  - Also you will need a 2CAPTCHA API or HCAPTCHA API depending on what platform you'll be automating.
- 

**At the time of this writing this bot currently supports;**

- Tinder
- Bumble
- Badoo
- OKCupid
- Plenty of Fish
- Reddit
- Twitter

More platforms will be added as the beta process proceeds. Likewise some platforms will likely be removed due to patches.

*If your antivirus blocks the download or script like windows defender sometimes does, you'll need to turn off the antivirus while you set up the bot. The method that I use to scrape the proxies for you seems to trigger a couple different anti-viruses with a false positive. It'll work fine once you either create an exclusion for the directory you're downloading the zip file into, or just turning off "real-time monitoring" temporarily.*

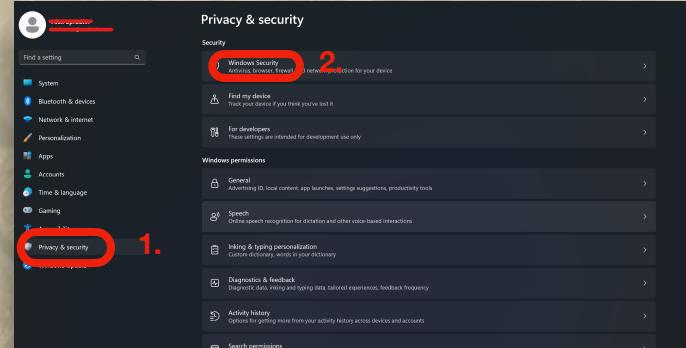

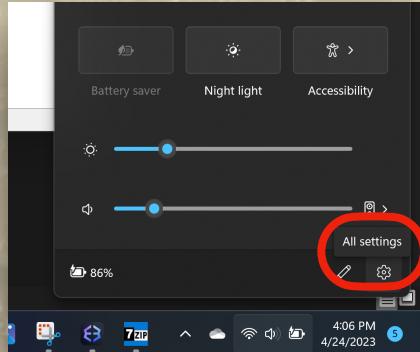

*We shouldn't get the false positives anymore now that we have our licensing issued, but sometimes the AV companies are slow to update certificates.*

*Happy Pirating!*

# Traffic Pirate Bot

To make an exclusion folder go in to your computers settings and select "Privacy & Security" ...then "Windows Security"

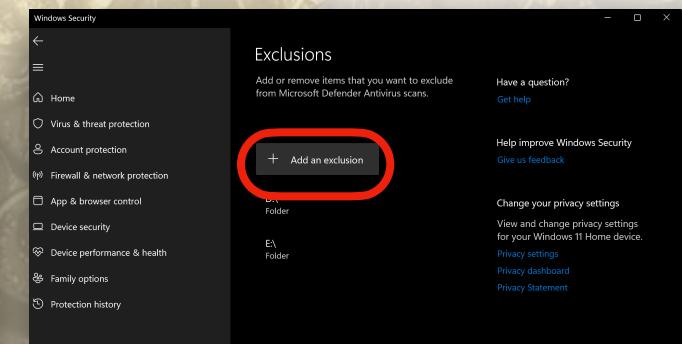

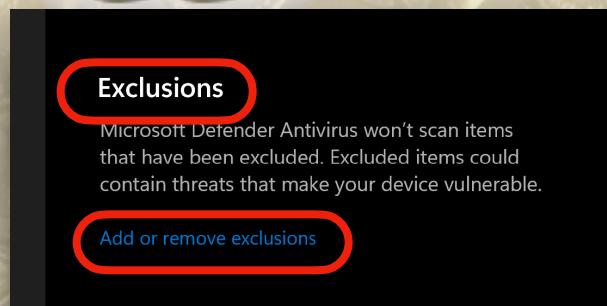

Choose "Virus & Threat Protection"

You may or may not already have folders there, either way click on "Add an exclusion"

And scroll down till you see "Exclusions"  
click "Add or Remove Exclusions"  
click "Add or Remove Exclusions"

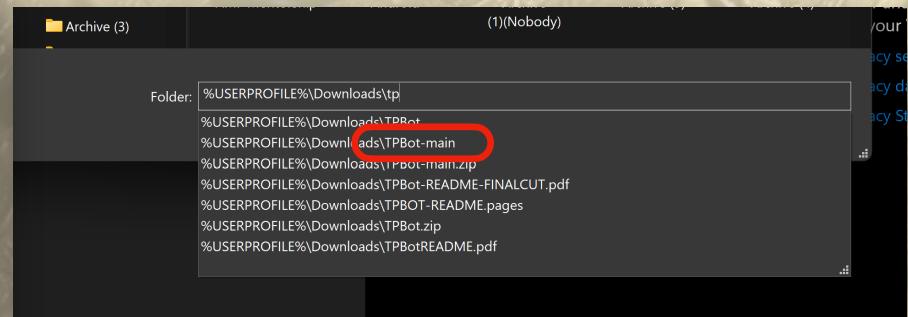

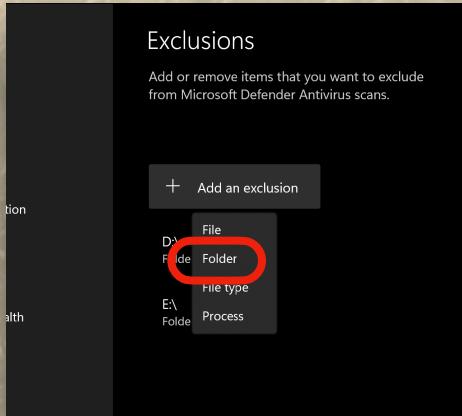

## Traffic Pirate Bot

In the drop down menu  
select "Folder"

When the 'browse' window comes up copy & paste  
this into the 'Folder' input field;

%USERPROFILE%\Downloads\TPBot-main

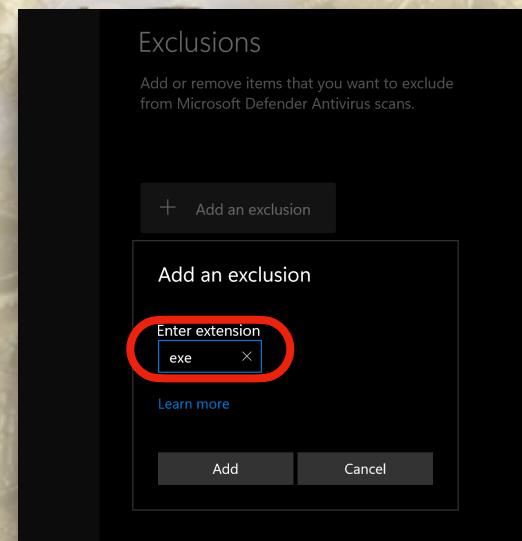

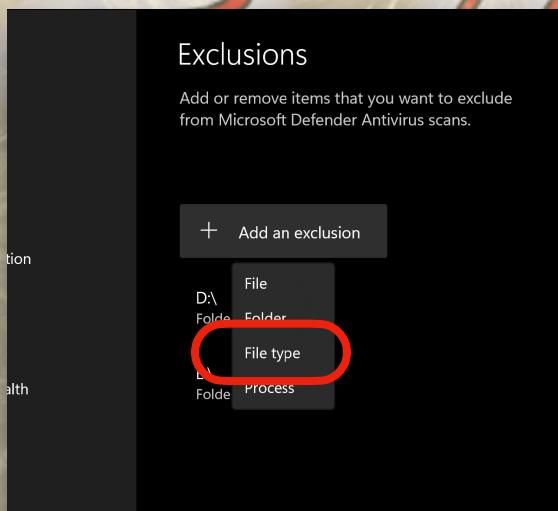

...You should see a couple show up.

↑ Select the name of the extracted directory ↑

You can also do this... When you get  
the drop down menu, select  
"File type"

And here it wants you to type in the  
file extension of the bot, which  
is exe so type "exe" then click "Add"

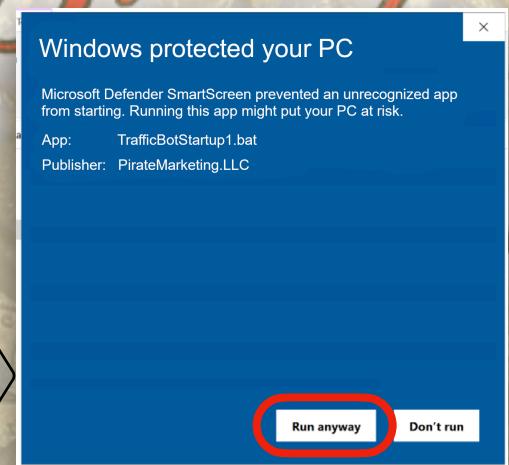

Happy Pirating!

## Traffic Pirate Bot

You must create the above exclusion that covers the "TPBot-main" directory BEFORE you extract the "TrafficPirate(Binaries).7z" archive, for which the password to decrypt is **betaTest**

- Now you can enter the "TPBot-main" directory and extract the 'binaries' 7z file with whichever software you prefer. If you've preformed the above exclusion correctly you should have no further issues.
- Once you **extract the "TrafficBot(Binaries).7z" directory**, you'll see 2 new files in the "main" directory. There will be an "uninstall.zip" which you only need to uninstall or purge log files, the other one is the "TrafficBotStartup1"... Thats the bot itself.
- Double click on the "TrafficBotStartup1" file** to set up dependancies and start the bot.
- Once the main menu appears the rest is self explanatory.
- Just follow the GUI prompts and fill out the input information.
- Click 'Deploy' to start the bot live.**  
(OR)
- Click 'Debug' to start the bot in a local environment for testing. (this is only needed for submitting a bug report)

The bot uses a free API library written by me to utilize rotating proxies scraped with another bot I have hosted in the cloud. When the bot calls this library, the function may be blocked by windows or you may get a notification that has a 'Run Anyway' option... If you don't see that try "More Info" then "Run Anyway"
